If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Aminostyrylnaphthalene compound

Inventors (please provide full names): MARI ICHIMURA, TADASHI ISHIBASHI, SHINICHIRO TAMURA

Earliest Priority Filing Date: 3/24/03

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

Please search

Formula A shown in claim 1.

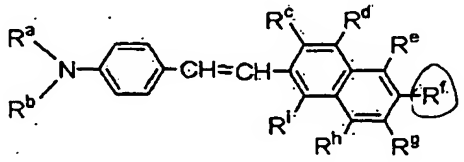
WHAT IS CLAIMED IS:

1. An organic electroluminescent device comprising an anode, a cathode, and an organic layer arranged between said anode and said cathode, wherein at least a part of said organic layer comprises at least one aminostyrylnaphthalene compound represented by the following formula [A]:

Formula [A]



wherein:

R^a and R^b may be the same or different and each independently represents a substituted or unsubstituted aryl group,

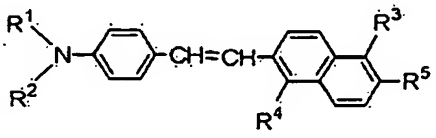
R^c, R^d, R^e, R^g, R^h and R^i may be the same or different, at least one of R^c, R^d, R^e, R^g, R^h and R^i independently represents a hydrogen atom, a cyano group, a nitro group, a trifluoromethyl group or a halogen atom, and the remaining one or ones of R^c, R^d, R^e, R^g, R^h and R^i, if any, are each a hydrogen atom, a cyano group, a nitro group, a trifluoromethyl group or a halogen atom, and

R^f represents a substituted or unsubstituted, saturated or unsaturated alkyl group, a substituted or

unsubstituted alicyclic hydrocarbon group, a substituted or unsubstituted aryl group, a substituted or unsubstituted alkoxyl group, a substituted or unsubstituted alicyclic hydrocarbyloxy group or a substituted or unsubstituted aromatic hydrocarbyloxy group.

2. The organic electroluminescent device according to claim 1, wherein at least said part of said organic layer comprises at least one aminostyrylnaphthalene compound represented by the following formula [I], [II] or [III]:

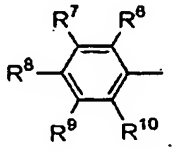
Formula [I]



wherein:

R^1 and R^2 may be the same or different and each independently represents a phenyl group represented by the following formula (1):

Formula (1)



wherein R^6, R^7, R^8, R^9 and R^{10} may be the same or

AB A red **light-emitting** layer, a green **light-emitting** layer and a blue **light-emitting** layer are arranged in this order between an anode and a cathode, and an intermediate layer composed of an organic material is disposed between the green **light-emitting** layer and the blue **light-emitting** layer. The HOMO-LUMO energy gap of the intermediate layer is larger than the HOMO-LUMO energy gap of a green **light-emitting** material constituting the green **light-emitting** layer. The intermediate layer has hole transport properties. A display using this organic EL device is provided with a color filter on the **light** taking-out surface side. By having such a structure, the organic EL device is capable to produce well-balanced, high luminance three color components, namely red, green and blue emission, which are suitable for a full color display.

I

AB Aminostyrylnaphthalene compds. are described by the general formula I (Ra and Rb = independently selected (un)substituted aryl groups; Rc, Rd, Re, Rg, Rh, and Ri are independently selected from H, CN, a nitro group, a trifluoromethyl group or a halogen atom; and Rf = (un)substituted (un)saturated alkyl, (un)substituted alicyclic hydrocarbon, (un)substituted aryl group, (un)substituted

alkoxyl, a(un)substituted alicyclic hydrocarbyloxy, or (un)substituted aromatic hydrocarbyloxy). Organic **electroluminescent** devices with layers incorporating the compds. are also described. Methods for the production of the aminostyrylnaphthalene derivs. are described which entail condensation of a 4-aminobenzaldehyde deriv.and ≥1 phosphonate ester or phosphonium. Phosphonate esters or phosphoniums useful for the reactions are also described, as are methods for their production which entail reacting a halogenated aryl compound with a trialkyl phosphite. Further, halogenated aryl compds. appropriate as precursors for the synthesis of the phosphonate esters or phosphoniums are described along with a method for their synthesis by reacting a naphthalene derivative with an N-halogenated succinimide.

AB The title method, which uses a pos. charging monolayer-type organic electrophotog. photoreceptor and contains a cleaning process of residual toner on the photoreceptor, includes the steps of: measuring the thickness of the **light**-sensitive layer of the photoreceptor and charging amount of the photoreceptor; calculating the exposure intensity, which shows ≤26 V variation after exposure on the **light**-sensitive layer having ≥15 μm difference in the thickness. The method uses a phthalocyanine charge-generating agent, naphthoquinone charge-transporting compound, and a stilbene-based hole-transporting compound The method provides constant **light** intensity for photoreceptor exposure after surface wearing of the photoreceptor.

AB We developed novel distyryl compds. aiming red **light-emitting** materials for organic EL active panels. Both **photoluminescence** and **electroluminescence** spectra have the peaks in the region of 630-650 nm. They have good fluorescence quantum yield(0.8-0.97, in solution), and high glass transition temperature(103-120°C). Use of BSN as an **emitting** material enables fabrication of fine red EL device that exhibits high luminance efficiency.

AB The invention provides a process and apparatus for deposition of organic material thin films having good characteristics from a plurality of materials which behave differently under heat by optimizing the conditions for deposition for each raw materials. In the deposition of a 1st material which evaps. after being melted under heat and/of a 2nd material which sublimes under heat, a 1st container having a 1st opening having the same or larger size than the surface area of the contained, said organic material, the flying angle of the vapor of the organic material from the opening being ≥90°, and a 2nd container having a 2nd opening smaller than the surface area of the contained, said organic material. The 1st and the 2nd containers (evaporator boats) will be made from Ta, Mo, W, or BN. Evaporation/sublimation velocities will be regulated properly, thereby providing films with uniform thicknesses.

I

AB Aminostyrylphenanthrenes shown as I [R1 = (substituted) aryl; R2 = unsubstituted aryl; R3-R5 = H, cyano, hydrocarbyl, etc.] are prepared by condensation of 4-(N,N-diarylamino)benzaldehydes with phosphonic acid esters and/or phosphoniums which are prepared by reacting halogenated phenanthrenes (prepared from phenanthrenes and N-halogenated succinimides) with trialkyl phosphites or PPh3. I are useful for organic **electroluminescent** material which **emit** red **lights** whose maximum emission wavelength can be varied based on substituents introduced to the structures. Moreover, I has high-m.p., good heat resistance, enhanced elec., thermal, or chemical stabilities, are amorphous which easily give glass states, and are sublimable and hence formation of amorphous films by vapor deposition is easy.

I

AB Title compds. I [R1-R4 = (un)substituted aryl; R5, R6 = H, cyano, NO2, CF3, halo], useful for **electroluminescent** devices, and their intermediates are prepared 1,5-Dicyano-2,6-bis(diethoxyphosphorylmethyl)naphthalene (preparation given) was treated with NaH followed by p-MeOC6H4NPhC6H4CHO-p in THF/DMF at room temperature for 10 h to give 20% I (R1 = R4 = C6H4OMe-p, R2 = R3 = Ph, R5 = R6 = cyano) having visible absorption maximum at 493 nm and fluorescence maximum at 545 nm.

AB Elec. photosensitive compns. for use in photoelectrophoretic imaging process contain an elec. photosensitive polymer of the formula I (R, R3 = C1-18 alkyl or aryl; R1, R2 = H or an electron-withdrawing group; Z = arylene; Z1, Z2 = alkylene or arylene; Z3, Z4 = oxy, imino, thio, carbonyloxy, oxycarbonyl, iminocarbonyl, carbonyldioxy, arylene, carbonyloxycarbonyl, sulfonyl, and the like; a, d = 0 or 1; b, c = 1-25; n ≥ 2). Thus, an elec. sensitive composition was prepared by ball-milling Cyan Blue GTNF in a CH2Cl2 solution of II with 1/8 in. stainless steel balls for 5 days. The pigment to polymer ratio was 1/0.5 by weight The dispersion was then precipitated by pouring into Isopar G, the elec. photosensitive composite particles isolated by centrifuging, and the precipitate then redispersed with lauryl methacrylate-Li methacrylate-methacrylic acid-vinyltoluene copolymer in isopar at a pigment to polymer ratio of 1/0.5 by weight The resulting dispersion showed a relative sensitivity to a red filtered white **light** exposure of 640 for a pos. image and 580 for a neg. image vs. 100 and 100, resp., for a II-free control.
